Green Energy in System Monitor

Kai Uwe Broulik <kde@broulik.de>

**Paid like 40€~~€~~/mo
in electricity**

**Something bad
happened in
early 2022**

Got myself a solar installation lol/

**Comes with a
proprietary
vendor cloud...**

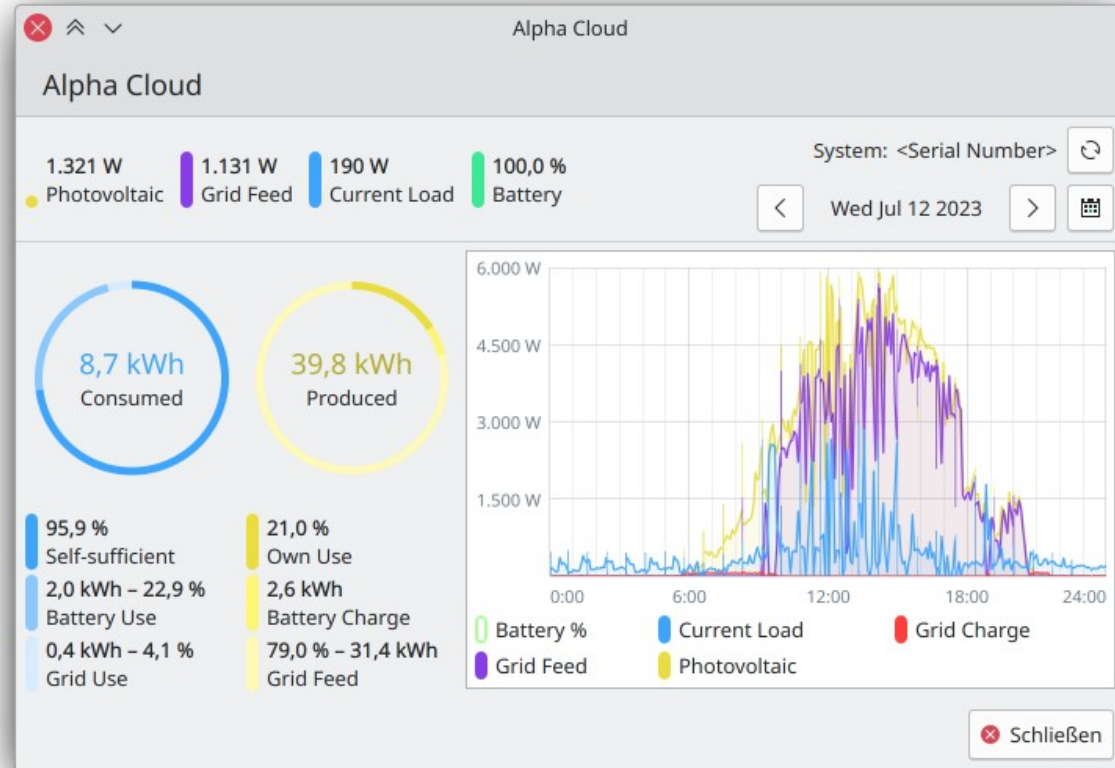

Features

Features

KInfoCenter Module

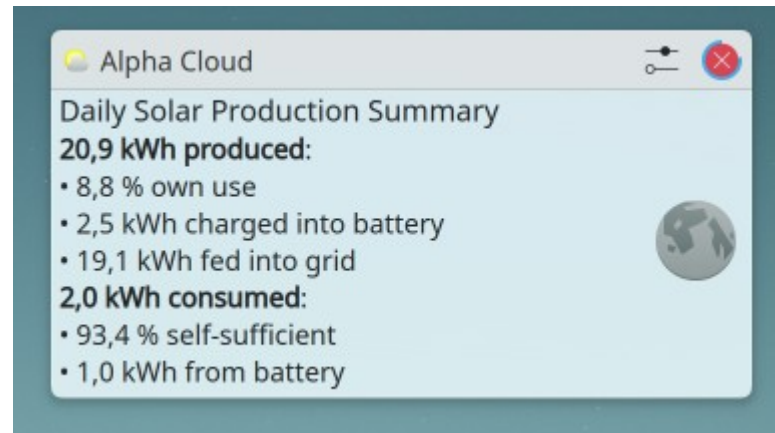

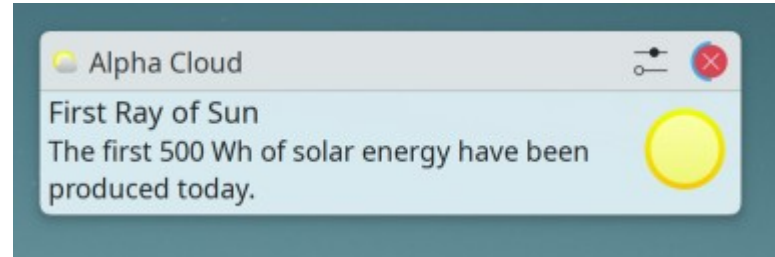

- Historic daily data in a plot
- Live data
- Self-sufficiency vs. grid use
- Own use vs. grid feed

Features

KDED Notifier

- First Ray of Sun
- Storage battery SOC
- Summary at end of day
- Go start the dishwasher now!

Features

CLI

- Fetch system info, live, historic, cumulative data
- Basic conditional checks for scripting
- JSON output possible

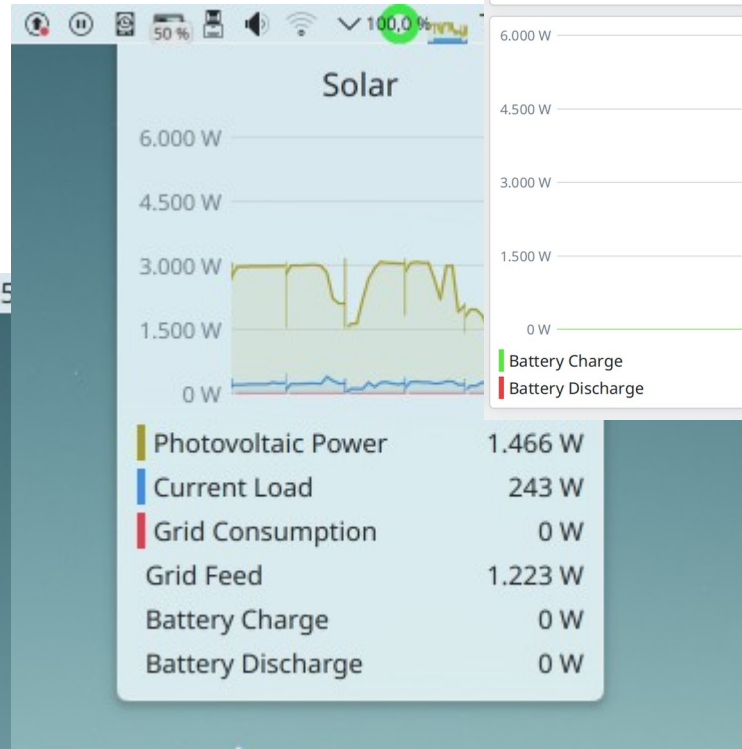

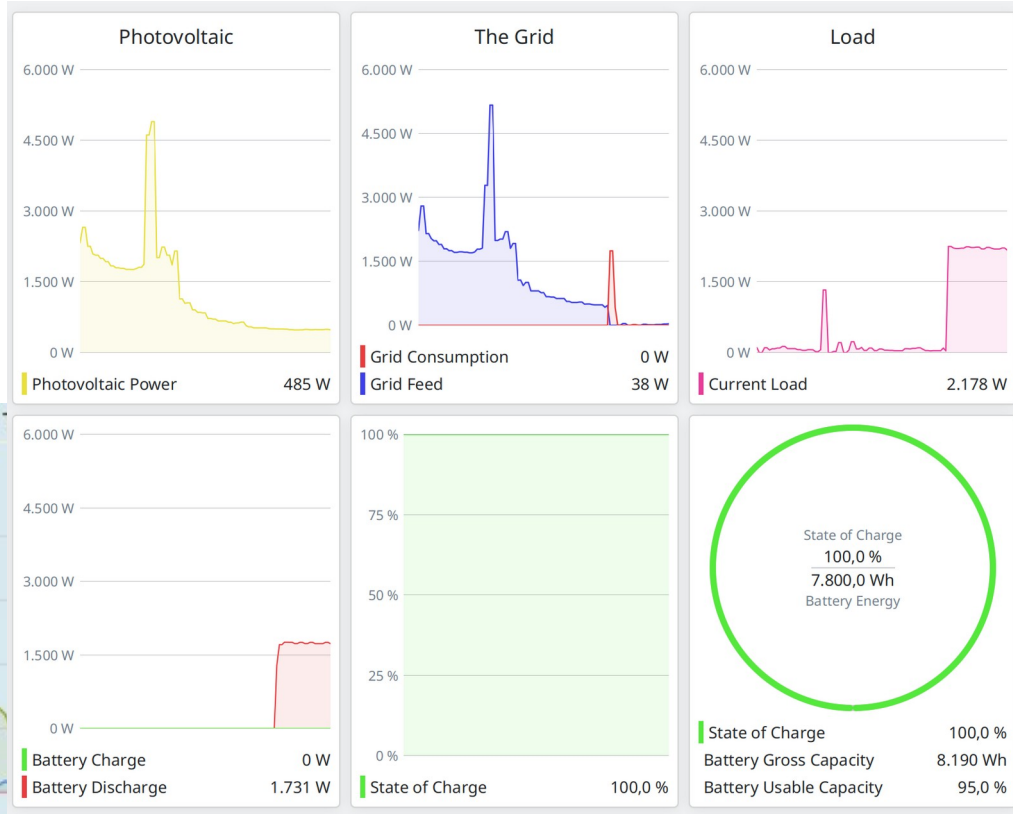

```
$ qalphacloud live
QAlphaCloud CLI
[...]
Read last power data:
Fetching primary serial number...
photovoltaicPower: 1774
currentLoad: 213
gridPower: -1561
batteryPower: 0
batterySoc: 100
```

```
$ qalphacloud --property photovoltaicPower -gt 2000 live
QAlphaCloud CLI
[...]
Read last power data:
Fetching primary serial number...
Condition (photovoltaicPower) 1774 > 2000 is NOT met
$ echo $?
1
```

Features

KSystemStats Plug-in

- Live data
- Daily cumulative data
- System info
- Full flexibility of System Monitor

Demo

Why?

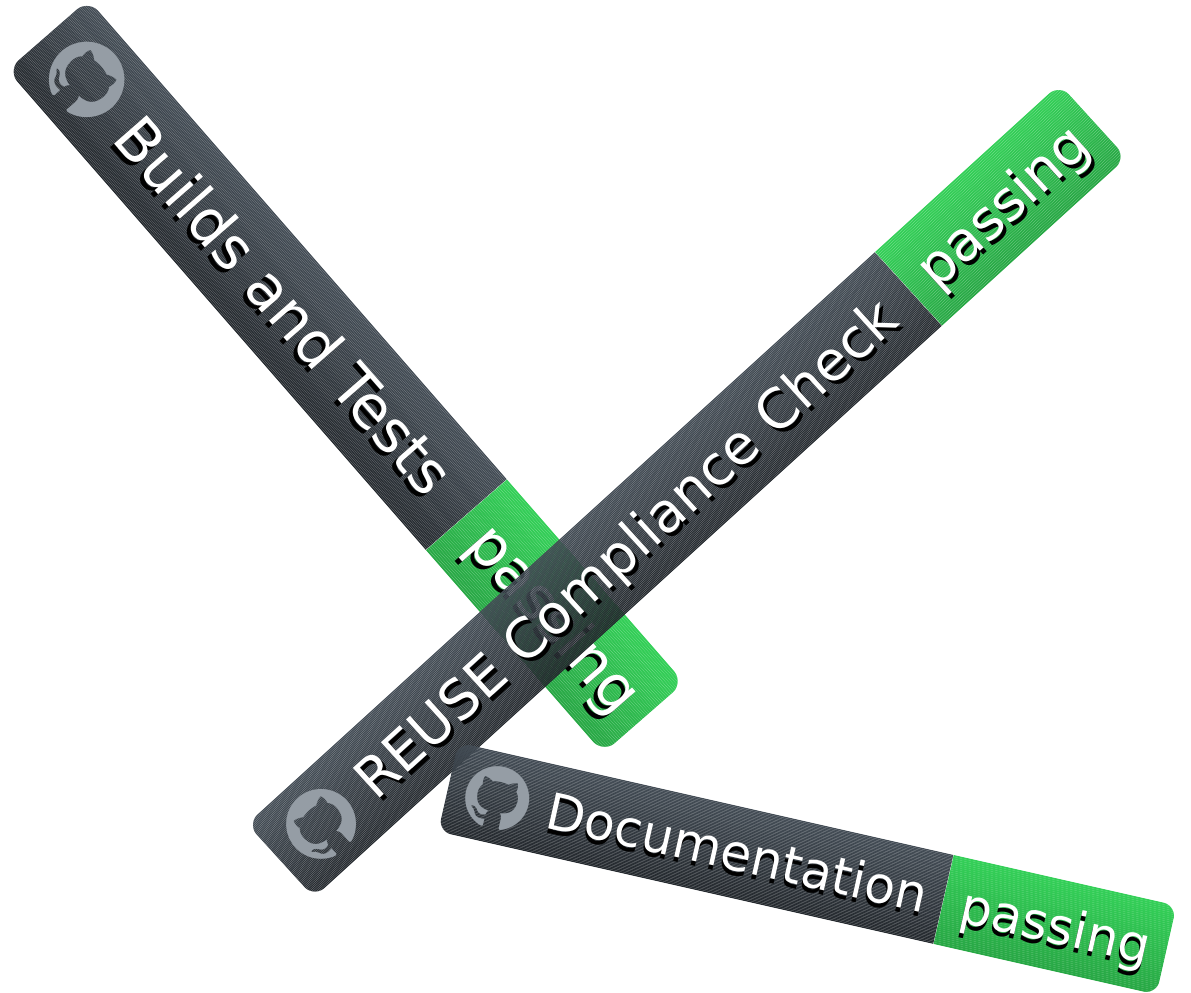

Why?

Because I can.

Why?

- Written from scratch, C++ *and* QML bindings
- Outside KDE Infrastructure
- Code coverage analysis, unit tests
- Code formatting
- Doxygen documentation
- Full REUSE compliance
- Example code

Why?

- Library (~2,600 loc + tests)
 - Qt Network, Qt JSON
- KInfoCenter purely QML, (~1,000 loc)
 - Using KQuickCharts QML bindings
- KSystemStats (~600 loc)
 - Already knew “Watt” and “Watt-Hour” units

Why?

**There's
No Framework
For That™**

Thanks!
